Price Movements
January 1986

The Producer Price Index for Finished Goods dropped 0.7 percent from December 1985 to January 1986, seasonally adjusted. The index had risen considerably in each month of the last quarter of 1985, following a period of virtually no net change from September 1984 through September 1985. Prices received by producers of intermediate goods also turned down in January, following three small monthly increases. Crude material prices fell 1.4 percent over the month, after decreasing by a smaller amount in December and climbing in each of the 3 months before that. (See table A.)

A dramatic downturn in prices for finished energy goods was responsible for most of the reversal in the Finished Goods Price Index in January. The consumer foods index also moved down, after substantial monthly advances at the end of 1985. Finished goods other than foods and energy eased down slightly, following an equally small rise in December.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved down 0.3 percent in January to 296.2 (1967 = 100). Over the year, from January 1985 to January 1986, the Finished Goods Price Index increased 1.4 percent. During the same span, consumer food prices rose 0.4 percent, the index for finished energy goods moved down 1.0 percent, consumer goods other than foods and energy climbed 2.4 percent, and capital equipment prices advanced 2.2 percent. The intermediate goods index declined 0.7 percent over the 12 months ended in January 1986, while crude material prices dropped 5.5 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods moved down 0.8 percent in January, after increasing 0.6 percent in December. The index for finished energy goods declined 4.2 percent, after increasing 2.2 percent the previous month. Prices for both gasoline and home heating oil turned down sharply, following advances in previous months. In contrast, the natural gas index turned up after several months of decline, and prices for finished lubricants climbed more than in the preceding month.

After rising 0.7 percent in December, the index for consumer foods moved down 0.4 percent. Prices fell more than in December for beef and veal, pork, and processed poultry. Prices turned down after rising more than they had a month earlier for fresh vegetables and eggs. In contrast, prices for roasted coffee soared 17.4 percent. Indexes for confectionery end products, fish, and shortening and cooking oils rose moderately.

In addition, data for September 1985 have been revised to reflect the availability of late reports and corrections by respondents.

[1] Figures shown above and elswhere in this report may differ from those previously reported. See table A.

The index for finished consumer goods other than foods and energy was unchanged in January, following a 0.2-percent increase in December. Advances were registered for drugs, tobacco products, cosmetics, and periodicals. In contrast, prices for passenger cars and light trucks were considerably lower, reflecting a renewal of subsidized financing by manufacturers. Apparel, household appliances, small arms and ammunition, and home electronic equipment also decreased.

Capital equipment. The Producer Price Index for capital equipment edged down 0.1 percent, after inching up 0.1 percent in December. Notable declines included light motor vehicles, truck trailers, chemical industry machinery, and pumps and compressors. Prices advanced however, for heavy trucks, office machinery, machine tools, and construction machinery.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components fell 0.4 percent from December to January after seasonal adjustment. The major cause of this decrease was the intermediate energy index, which moved down 3.2 percent. Very sharp price decreases occurred for gasoline, diesel fuels, residual fuel, and kerosene. In addition, prices declined for jet fuels and coke oven products. Liquefied petroleum gas prices continued to advance, but not nearly as much as in other recent months.

The steel mill products index fell 4.5 percent, in the wake of a fundamental shift in pricing strategy by the domestic steel industry. Many producers cut list prices for steel products sharply, to bring them into alignment with actual transaction prices. (Market transaction prices generally have not been made available from the steel industry for the PPI.) Among nonferrous metals, prices advanced for gold, silver, copper, and aluminum.

Following a year and a half of flat or declining prices, materials for nondurable manufacturing rose 0.4 percent. Substantial increases were noted for industrial chemicals, inedible fats and oils, paint materials, and synthetic rubber, but, not as fertilizer material prices fell sharply.

The construction materials and components index moved up 0.2 percent. Higher prices also were registered for plastic plumbing products, wiring devices, and clay construction products. In contrast, prices declined for plywood and millwork.

Among miscellaneous intermediate goods, prices rose for pesticides and plastic parts, but moved down for electric motors and generators and mixed fertilizers. Within the intermediate foods and feeds category, increases for prepared animal feeds, refined sugar, and crude vegetable oils were offset by declines for meats, flour, and confectionery materials.

Crude goods

The Producer Price Index for Crude Materials for Further Processing fell 1.4 percent on a seasonally adjusted basis, following a decrease of 0.5 percent in December. The faster decline in the crude materials index was largely due to falling prices for various foodstuffs.

After moving down 0.5 percent in the preceding month, the index for crude foodstuffs and feedstuffs dropped 2.6 percent. Prices for turkeys plummeted a record 33.2 percent, following a modest advance in December. Cattle prices fell more than in the previous month. Prices for corn, fresh vegetables, and wheat turned down after rising in December. Raw cane sugar prices, in contrast, advanced substantially.

The index for crude energy materials rose 0.1 percent, after falling 0.5 percent in December. The natural gas index turned up after dropping for 7 consecutive months. Crude petroleum prices, however, declined following increases in each of the 4 preceding months.

The index for crude nonfood materials other than energy fell 0.3 percent, about the same as in December. Substantial declines were noted for leaf tobacco and logs and timber. Construction sand and gravel and aluminum base scrap also decreased. The price of raw cotton showed a sizable advance, while moderate increases were registered for ferrous and copper base scrap, cattle hides, and wastepaper.

Net output price indexes for major industry groups

Price indexes for the net output of many major industry groups within the mining and manufacturing sectors moved up only slightly from December 1985 to January 1986. (See table 4 and the article on page 6 later in this report.) One of the few industry groups with a substantial increase in January was tobacco manufactures (up 3.8 percent). The 8.2-percent advance in this index from January 1985 to January 1986 was by far the largest 12-month rise for any major industry group. Prices for the net output of the printing and publishing industry group climbed 1.8 percent over the month and 4.8 percent over the year, ranking second to tobacco manufactures in both time periods. In contrast, prices received by domestic petroleum refiners for output sold outside their own industry fell 6.0 percent over the month. A few major industry groups inched down in January.

Expansion of the Producer Price Index

Effective with this issue of *Producer Price Indexes*, coverage of the industrial sector of the economy according to the methodology of the Producer Price Index Revision, a process that began in the late 1970's, has been virtually completed. Indexes for an additional 74 industries have now been calculated. This expansion includes several areas of the economy never before covered in the PPI, such as oil and gas well services, ordnance, communication equipment, and shipbuilding and repairing. It also improves coverage in such areas as textiles, nonmetallic minerals, metal ores, instruments, and aircraft. The PPI Revision program now covers 482 industries, which represent 98 percent of the total value of domestic mining and manufacturing production. A few manufacturing industries that account for the remaining 2 percent—computers, and guided missiles and space vehicles—present special problems and will be studied further. The industries being calculated for the first time this month are the following:

A total of 168 new items has been added to the list of commodities included in the Producer Price Index. All commodity price indexes (except for agricultural products, scrap materials, electric power, and a few other scattered items) are now calculated using the revised PPI methodology. The total number of commodity indexes derived from the revised methodology currently stands at about 2,800. This number will change periodically in the future as industries already covered are resampled to ensure that the PPI remains representative and up-to-date. For further information on specific additions, deletions, and recodes of indexes that are occurring this month, see tables 11 through 15.

Also effective with publication of January 1986 data, all remaining indexes for imports such as crude natural rubber, cocoa beans, and tin have been eliminated. Publication of the few remaining unit dollar prices has also been discontinued. The PPI is now strictly a system of price *indexes* measuring changes in prices received by *domestic* producers. BLS has a separate survey that provides price indexes covering all imported goods.

The Technical Note, "Brief Explanation of Producer Price Indexes" has been rewritten to reflect the completion of the transition to the new methodology.

Price Indexes for the Net Output of Major Mining and Manufacturing Industry Groups

Effective with this report, the higher level SIC price indexes will be spotlighted in a summary analysis of monthly price movements. The traditional method of analysis, which uses the commodity-based stage-of-processing concept, will be complemented by tracing inflationary and deflationary pressures in the economy using the net-output weighted indexes. These summary indexes will appear in table 4 beginning this month. They had previously been presented in table 14. Old table 4, "Producer Price Indexes for the net output of selected industries and their products," has been renumbered as table 5.

Table 4 shows price indexes for 2-digit Standard Industrial Classification (SIC) major industry groups, as well as for the total mining sector and the total manufacturing sector. Comprehensive price coverage of the industrial portion of the U.S. economy according to the SIC classification system makes it much easier to compare PPI data with other economic time series arranged by the same system.

One principal distinguishing feature of the industry price indexes is that they are aggregated using net output weights. That is, only prices for those commodities shipped to establishments outside the sector in question are counted. In contrast, gross shipment weights are used for weighting traditional commodity grouping price indexes, which are calculated without regard to the origin or destination of commodities. The advantage of net-output-weighted price indexes is that they more accurately represent inter-industry price effects, that is, the inflationary impact one industry has on other industries that purchase its products.

Data users should be aware of the implications of net output weighting. For example, the index for the transportation equipment industry group (SIC 37) excludes that portion of the output of the motor vehicle parts and accessories industry (SIC 3714) sold to domestic original equipment manufacturers, which are also classified within SIC 37. Likewise, the total manufacturing sector price index includes only shipments of goods to final demand (e.g., consumers and exporters) and shipments to nonmanufacturing sectors (e.g., construction and agriculture). The considerable proportion of the total shipments from manufacturing industries that goes to other manufacturers (for example, semifinished goods, fuels, and supplies) is excluded from this index. For this reason, monthly percent changes for the total mining sector index and the total manufacturing sector index may not be consistent with the percent changes of their 2-digit components. That is, the additive consistency property of traditional commodity grouping indexes does industry net output price indexes.

To avoid confusing the major industry group indexes shown in table 4 with the traditional major commodity group indexes shown in table 3, data users should pay special heed to the BLS index-naming conventions and index codes. Because of differences in coverage and aggregation methodology, indexes from the two tables that have similar titles may move somewhat differently.

Recalculation of Seasonal Adjustment Factors

Effective with this issue of *Producer Price Indexes,* seasonal adjustment factors have been recalculated to reflect 1985 price movement patterns for stage-of-processing (SOP) and commodity groupings. This routine annual recalculation may affect seasonally adjusted indexes and percent changes from January 1981 to the present. Revised seasonally adjusted data for this period, as well as seasonal factors to be used through December 1986, are available on request from BLS. Table C shows 1985 monthly seasonally adjusted percent changes for the three major SOP categories calculated with the old seasonal factors, compared with the percent changes for recalculated indexes that incorporate the new seasonal factors.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 85 percent of total finished goods, about 85 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

[2] All data are subject to revision 4 months after original publication.

[3] Not seasonally adjusted.

NOTE: Seasonally adjusted data shown may differ from those previously reported. See footnote 1 on table A.

Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

[2] Data for September 1985 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

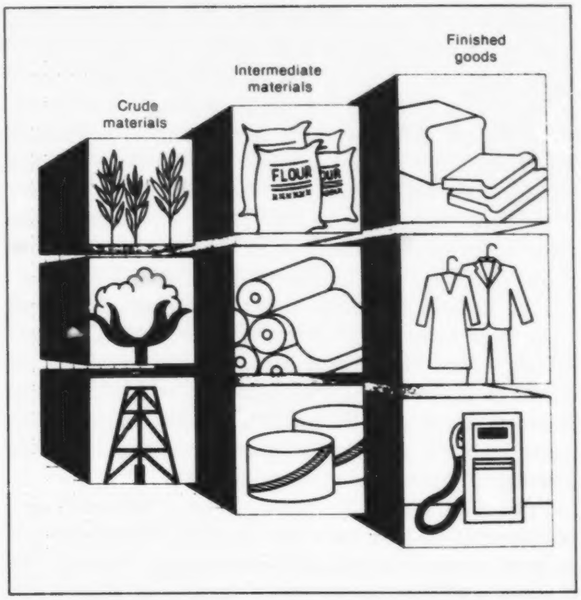
There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.



Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5

Index Percent Change

Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from $100 in 1967 to $288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties,* BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Price Movements
February 1986

The Producer Price Index for Finished Goods fell 1.6 percent seasonally adjusted from January to February. This was the largest 1-month decrease since the Finished Goods Price Index was first calculated in 1947. Prices received by producers of intermediate goods moved down a near-record 1.4 percent, after a 0.4-percent decline in the previous month. Crude material prices dropped 5.0 percent, likewise close to the largest decrease ever registered. (See table A.)

The substantial declines at all three major stages of processing were principally due to steep reductions in prices for most energy goods. Prices for many food-related items declined as well. Prices for a broad range of crude and intermediate materials other than foods and energy also moved down somewhat in February, while the index for finished goods other than foods and energy showed no change. Most price indexes for energy goods are now back to the levels that prevailed in 1979 or 1980. The index for finished energy goods, for example, is at the lowest level since January 1980, and the crude petroleum index now nearly matches its December 1979 level.

Before seasonal adjustment, the Producer Price Index for Finished Goods decreased 1.3 percent in February to 292.3 (1967 = 100). Over the year from February 1985 to February 1986, the Finished Goods Price Index edged down 0.1 percent. During the same period, prices received by producers of consumer foods fell 1.2 percent, the finished energy goods index dropped 8.0 percent, consumer goods other than foods and energy advanced 2.2 percent, and capital equipment prices rose 1.7 percent. The intermediate goods index declined 1.6 percent over the 12 months ended in February 1986, and crude material prices were down 8.7 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods fell 2.0 percent in February on a seasonally adjusted basis,after a decline of 0.8 percent in January. The index for finished energy goods plunged 9.4 percent, following a 4.2-percent drop in the previous month. Prices for both home heating oil and gasoline registered record decreases (26.2 and 11.1 percent) in February. Prices for finished lubricants, however, moved up.

After moving down 0.4 percent in January, the index for consumer foods declined 1.6 percent. Prices for beef and veal, pork, fresh vegetables, and eggs fell much more than they had the month earlier. Prices for shortening and cooking oils turned down after rising

sharply for several months. Processed poultry prices also fell but not as much as in January. However, prices for soft drinks rose faster than they had the previous month. Prices for roasted coffee and confectionery end products continued to rise.

The index for finished consumer goods other than foods and energy showed almost no change for the second consecutive month. Advances occurred for tobacco products, women's apparel, passenger cars, books, and newspapers. In contrast, prices decreased for light motor trucks and household flatware.

Capital equipment. The Producer Price Index for capital equipment inched up 0.1 percent, after edging down 0.1 percent in January. Increases for printing trades machinery, food products machinery, and service industry machinery more than offset lower prices for trucks.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components dropped 1.4 percent on a seasonally adjusted basis, by far the largest decrease in over 12 years. This resulted mainly from the record 7.1-percent drop in the intermediate energy index. Diesel fuel and kerosene prices fell over 20 percent, more than twice as much as in any previous month. Gasoline and residual fuel prices fell more than 10 percent, and prices for liquefied petroleum gas and jet fuels also declined sharply. On the other hand, electric power prices turned upward.

Price decreases were also prevalent in intermediate goods categories other than energy. The index for durable manufacturing materials declined 0.8 percent because of lower prices for steel mill products, gold, silver, and lead. The index of materials for nondurable manufacturing moved down 0.2 percent. Decreases were recorded for textile materials, paperboard, nitrogenates, gum and wood chemicals, and inedible fats and oils. These were partly offset by a substantial advance in prices for plastic resins and materials.

Led by a decline in prices for softwood lumber, the construction materials and components index fell 0.3 percent. However, prices for plastic construction products continued to advance substantially, although not as much as in January. Among other intermediate goods categories, prices for pesticides fell. The intermediate foods and feeds index declined 1.5 percent because of lower prices for most items, particularly meats, animal feeds, and crude vegetable oils.

Crude goods

The Producer Price Index for Crude Materials for Further Processing moved down 5.0 percent seasonally adjusted, following decreases of 0.5 and 1.4 percent in December and January. The February fall was the largest monthly decline since September 1973. Half of the decrease is attributable to a precipitous drop in the crude petroleum index; a broad array of other items also moved down.

The crude energy materials index fell 8.2 percent. Prices for crude petroleum plunged a record 20.3 percent, equalling the net decline of the preceding 4 years. Prices for coal turned down after rising in January.

After moving down 2.6 percent in the previous month, the index for crude foodstuffs and feedstuffs fell 3.6 percent. Prices for cattle, chickens, fresh vegetables, and unprocessed fish fell more than in the preceding month. Hog prices turned down following a January increase and wheat prices dropped considerably less than in January. Advances were registered for turkeys and soybeans.

The index for crude nonfood materials other than energy dropped 3.0 percent, following a 0.3-percent decline in January. Prices turned down for iron and steel scrap and copper base scrap after rising in the previous month, and softwood log and timber prices fell more sharply than in January. In contrast, prices rose for aluminum base scrap, wastepaper, and raw cotton.

Net output price indexes for major industry groups

From January to February, the Producer Price Index for the net output of total manufacturing industries dropped 1.4 percent, while the net output price index for total mining industries fell 6.1 percent. (See table 4.) Sharply lower indexes for energy industries dominated these downward movements. Within the manufacturing sector, prices received by domestic petroleum refiners for output sold outside their own industry decreased 12.1 percent over the month. The 7.4-percent decline in the oil and gas extraction industry index was by far the most important development within the mining sector. The only other decreases of any size in February were recorded for metal mining (down 0.7 percent), the food and the bituminous coal industries (both down 0.5 percent), and primary metal industries (down 0.4 percent).

Net output price indexes for the apparel and the chemicals industries both advanced 0.4 percent. Indexes for tobacco manufactures and the printing and publishing industry, both of which had climbed substantially in January, moved up only a little in February.

NOTE: For a description of the methodology and interpretation of net ouput price indexes, see *Producer Price Indexes Data for January 1986,* page 6.

Correction

An error occurred in the text of the January report on page 2, right hand column, first paragraph, last sentence. The sentence should read: Substantial increases were noted for industrial chemicals, inedible fats and oils, paint materials, and synthetic rubber, but fertilizer material prices fell sharply.

[1] Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 85 percent of total finished goods, about 85 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

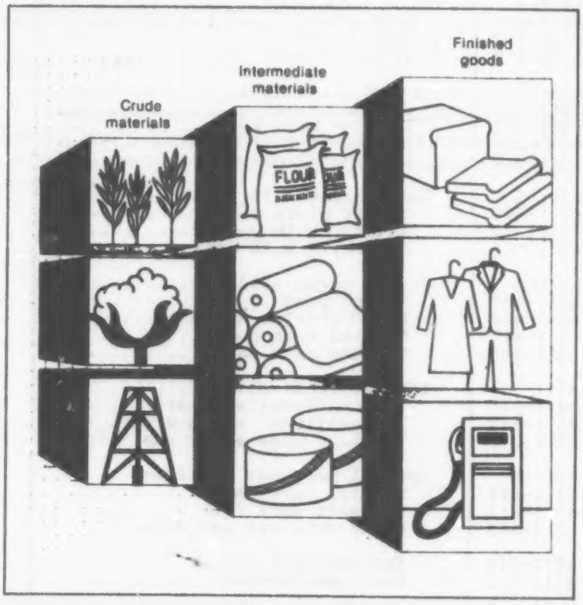
There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.



Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change

Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5

Index Percent Change

Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from $100 in 1967 to $288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
